

AICTE sponsored - Short Term Course

Location Tracking for Internet of Things

Date: March 21 - 26, 2022, classes will be held in online mode

With the ubiquitous deployment of IoT devices, it is often essential to accurately geo-locate or track such devices in real-time. Accurate localization not only enriches existing location-based services but also opens up the possibility for newer classes of applications and use-cases. What goes *under the hood* to estimate locations of these IoT devices under various deployment settings and constraints? The objective of the course is to introduce an array of technologies, systems and algorithmic concepts that make up the core of today's location-enabled services.
